

Use Cases:

1. Admin will create an event/conference.
2. Event/Conference must have a name, vote type which will specify by admin and depend on the context of conference, start date, end date and will generate a secret token for that particular event.
3. Basically, vote types could be anonymous in which participant details will be unknown or named vote where participant must need to provide his/her details or could be both.
4. there will be an option for admin to see active conferences e.g. how many conferences are still available.
5. Participants will first visit the website and register himself/herself.
6. After registration a secret token will be provided in order to login and participate in the voting.
7. Participants will not be able to visit or access voting page if the token is expired or incorrect.
8. After successful login participant can cast a vote and send the information to the admin.
9. Apart from this, Participants can also view details of the current agenda/conference.
10. Participants can give feedback if something is not good or they want to change something in the agenda/conference.
11. Admin will receive feedback and will either accept it or reject it.
12. All Questions per conference will be stored with some information i.e. likes/dislikes for the questions, vote type with total number of participants for that particular vote type and lastly, conference name.
13. All conference files will be available either publicly or privately depending upon the admin.
14. Participants can either logout himself/herself or will be logged out automatically after session/conference expires.
